R114: original other 15 problems + separately locked CVRP correction
Closeout: complete_labels
Labeling complete: True
Verified costs: 9600/9600
Full-pool winners: 2048/2048
Full-pool pairs: 1536/1536
CVRP scope: 10 methods, 32 TRAIN bases, 96 endpoints, 64 pairs, 960 tasks.
The original ICAM CVRP failure was a CUDA-to-NumPy host-audit boundary error,
not evidence that ICAM cannot solve CVRP. Original failed attempts are preserved.
Actual corrected execution: RTX3090; physical UUID: GPU-cb626bdb-4319-2f5e-b91f-17fcaa44a83d
Merged lock_sha256 = null. Execution locks are mapped per problem, not unified.
Native FP64 costs; exact winner ties by stable global ID. Missing is not zero.
Directed versus random uses the same problem/family/TRAIN-base full-pool intersection.
No trained function learner, TSP/ATSP response, full18 model, TEST/LIB or accuracy claim.
Related endpoints are not independent samples. No solver or GPU is used by this finisher.
A terminal partial/negative closeout is not labeling finished.

Parent full manifest file SHA256: d414f0c4cb4bf3d03049e95b632faf21ee70a1acbb926ea20a8d722f6f57ef68
Parent execution lock: f935df8d7e94738f1251cf4b970194c3c3f9ac8640489fdc22ae0547f97c110a
Corrected CVRP execution lock: 164ebc8f6cae456891895875c3aacab4960c3f3abd36d594e7bf88a147137593
