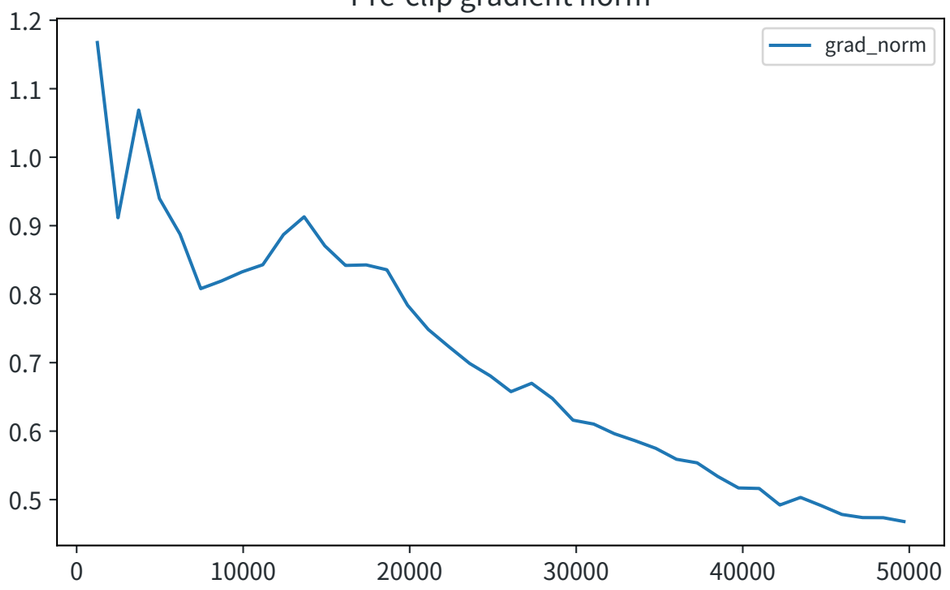
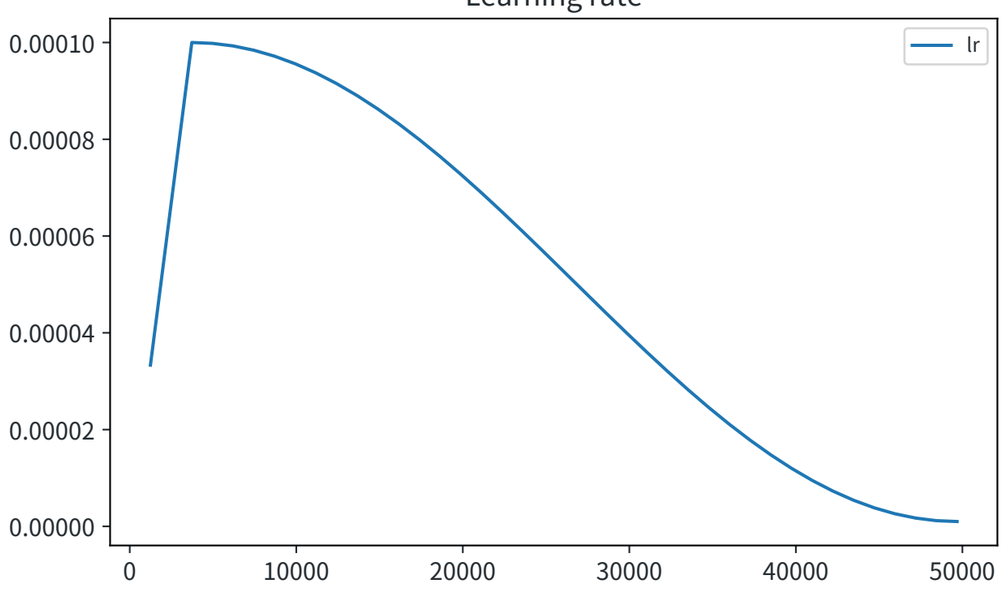
R81B_cross_instance_rank_seed2 | Base + AUC Optimization

Successful updates only; lambda ramp fixed before training.





R81B_cross_instance_rank_seed2 | Mechanism Evaluation

Historical R77B reference only. Matched R81A not run; no strict A/B causal conclusion.

Split	Mean applicable eligible-method competitive AUC	Diagnostic score rows
VAL	0.7899192229340782	267
TEST	0.7887878403654358	267

Per-method AUC, exact-tie ROC, and P/N score quantiles are in val/test CSVs.

Zero rescue uses native winner agreement, precision, and false-selection excess cost.

Both-wrong net saving = historical cost minus current cost on the same relevant rows.

Historical comparison is available on aligned VAL only; TEST rescue is descriptive, not paired.

No matched R81A exists. No strict A/B causal claim.

Fixed method-set totals; recall = native correct / native winner support.

Split / frozen set	Support	Correct	Rescued	Recall (%)	Precision (%)	False-pick regret (%)
VAL/zero	2648	2	2	0.08	40.00	20.280
VAL/near_zero	4358	15	8	0.34	62.50	10.158
TEST/zero	2601	6	6	0.23	46.15	2.440
TEST/near_zero	4279	17	17	0.40	60.71	2.274
